

- 1- Download and Install APIDOG from here : <https://apidog.com/>
- 2- Open It and Remove All Api's in Root (it's default apis, we don't need them)
- 3- In the LeftBar, go on API sections (as the img)

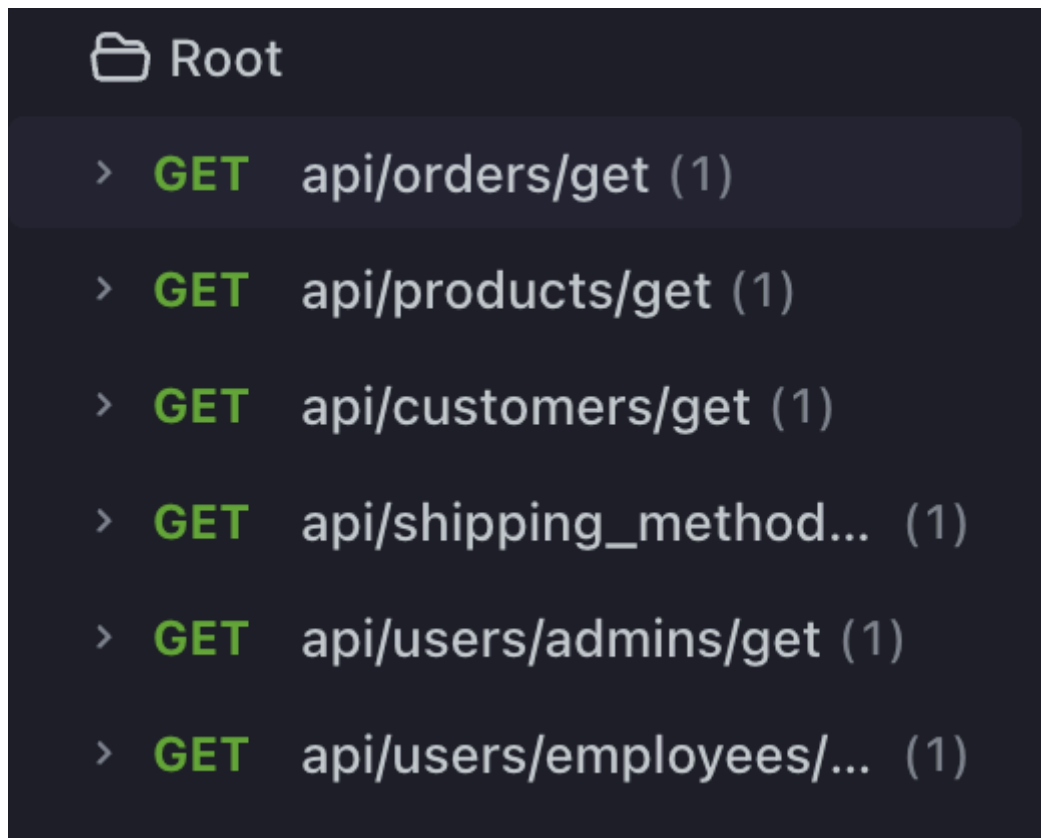

- 4- Hover on “+” button

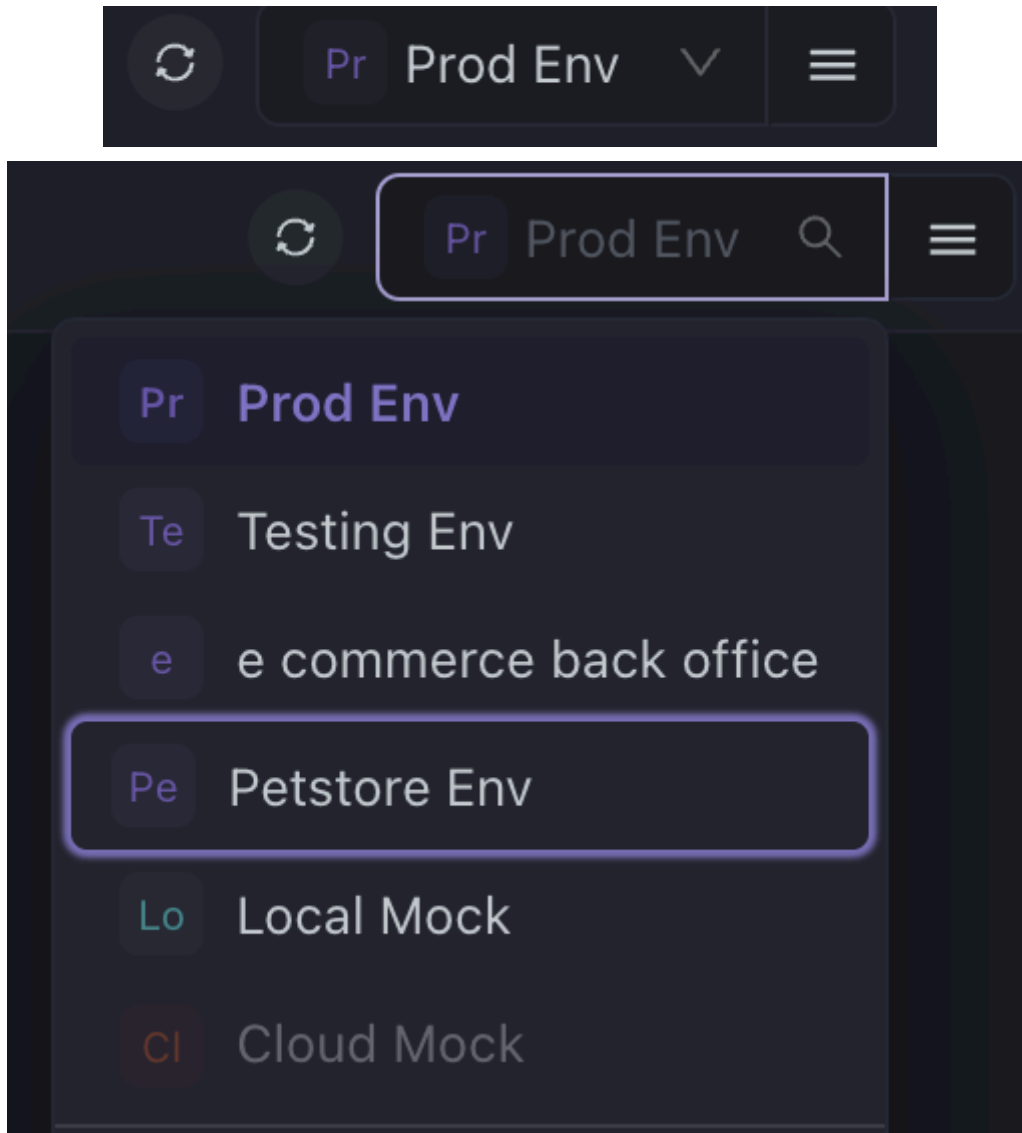

- 5- When you Hover the “+” button, click on import button :

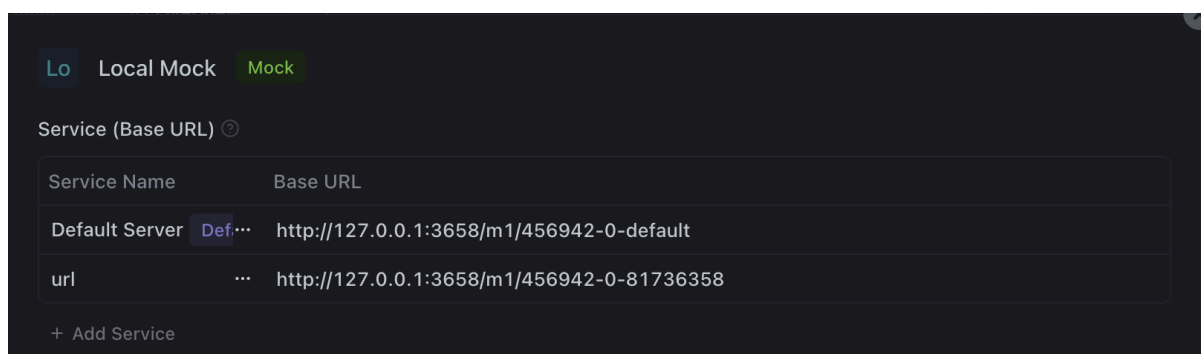

6- Import the file "backoffice_apis.apidog.json" and all api will be loaded

7- Click on the environment in right top of the page and choose the “Local Mock” environment

8- Click on the “burger button” in front of the environment selector and the Local Mock settings pop up will appear. Copy the substring after “/m1/” in the url.

9- Go to the backoffice data folder and open the “dataAPI.json” file (‘../e-commerce_backoffice/src/data/dataAPI.json’) and past into “api_key” the key you copy in the Local Mock url.

```
{  
  "api_key": "456942-0-81736358"  
}
```

10- That's all ! Now, you just need to launch the website using "npm start" command.
